PISTON WITH CAST-IN UNDERCROWN PINS FOR INCREASED HEAT DISSIPATION

ABSTRACT OF THE DISCLOSURE

A cast engine piston has a crown with a combustion surface and an undercrown for exposure to crankcase fluids. A plurality of pins extend from the undercrown to increase the surface area of the undercrown. The pins draw heat from the crown and dissipate the heat to the crankcase fluids. Crankcase oil may be sprayed, splashed, or misted against the pins to further increase heat dissipation.
